

The Wrath of a Disastrous Event, need not be compounded by poor sanitation and further health hazards.

When a catastrophe such as a tornado, hurricane, flood, or even a bad ice storm strikes...

Usually, and immediately, residences and whole communities can be left without their necessary utilities services. One of the most critical and essential losses during such events, is the loss of sufficient sewage, (human waste) disposal capabilities. This may even effect those who were mostly otherwise unscathed by the event.

With the loss of power and or water, community sewage handling and treatment facilities immediately go off line. Without adequate water supplies conventional in home toilets, even those with personal self-supported septic systems, also immediately fail to function without their water supplies. Conventional portable vault toilets, scattered through-out communities, can somewhat mitigate the human waste disposal crisis, but the reality is, and more often than not...

it is not practical, nor possible for most residents to access these and use them. When nature calls in the middle of the night; when residences are several flights of stairs up; or when people must otherwise walk very far at all to use one of these portable community toilets, the chances are and the reality is... they don't!

Backyards, nearby vacant lots, streets, and alleys are more likely to be used **spreading disease through-out the community**. In home chamber pots or conventional personal port-a-potties, are a viable solution to managing human waste, but, without a convenient and user friendly place or means of emptying and cleaning out these personal make shift privies... the waste is still likely to end-up disposed of in inappropriate places.

This is where the **SCAT MACHINE** portable human waste management systems, **comes to the rescue**.

From the Backwoods to Communities in Need

SCAT MACHINE human waste management systems were initially developed in the United States, in 1990, for use in “back country” recreation areas, and now play an essential role in preserving and keeping pristine back-country trails, lakes, rivers, and campsites clean and free of human waste and the diseases that can be spread by it.

These user and environmentally friendly systems are widely used to support human waste carry-out and disposal programs through-out many of our recreation areas today.

The **SCAT MACHINE** portable human waste management and disposal systems

make it easily and immediately possible to restore temporary human waste management and sanitation back into affected households and communities.

Here is how it works!

In an event in which sewage disposal systems may be rendered inoperative, portable **SCAT MACHINE** waste disposal systems can be readily and immediately set-up at strategic locations in or adjacent to an affected area. **Homes and businesses may continue to retain their own convenient and private “in house toilets”** by utilizing inexpensive and readily available plastic 5 gallon pails as chamber pots. Then periodically, (every few days) the pail is taken to a **SCAT MACHINE** waste disposal system located nearby for disposal.

The user simply places the pail into the **SCAT MACHINE**; the pail is automatically emptied; and in less than two minutes the container is washed out, sanitized and ready for use again. The waste is properly disposed through sewage treatment methods.

SCAT MACHINE waste management systems in any event, first and foremost... affords **people their own convenient, personal, and private in residence toilet systems**. And because of the convenient user friendly and sanitary nature in which these systems operate, people are most willing to use them resulting in...**the waste ends up where it should be, properly disposed of, thus minimizing further health hazards to residents already in a trying and traumatic situation.**
