

Undeveloped communities

Human Waste
in the Streets
and Back Alleys...

need not be an
inescapable condition.

Though it may be nearly impossible or impractical to install conventional toilets and sewage systems in shanty town communities or primitive villages, this need not be the reason for continued unsanitary conditions.

There is an alternative method!

“SCAT MACHINE” Human Waste Management and Disposal Systems

From the Backwoods to Communities in Need

SCAT MACHINE human waste management systems were initially developed in the United States, in 1990, for use in “back country” recreation areas, and now play an essential role in preserving and keeping pristine back-country trails, lakes, rivers, and campsites clean and free of human waste and the diseases that can be spread by it.

These user and eco-friendly systems, are widely used today, to support human waste carry-out and disposal programs. These waste management systems have made it possible to bring human waste management and sanitation to areas where there were none before. These systems have also, in many areas **replaced the undesirable community latrines**. Community latrines are just that, a community experience to share... disease. Further, such facilities can never be totally and practically located, to be conveniently accessible to all. The result is that human waste matter continues to end deposited in inappropriate places.

SCAT MACHINE waste management and disposal systems

first and foremost, affords *people their own*, personal, convenient and sanitary *in dwelling toilets*. But above all and most importantly, because of the convenient, user friendly and sanitary nature in which these systems operate, people are most willing to use the system. Resulting in, *the waste ends up properly disposed of and treated*.

Here is how it works!

SCAT MACHINE waste disposal systems can be readily set-up at a convenient and strategic location in a community. *Homes and businesses alike may now make use of their own private "in house toilets"* by utilizing inexpensive and readily available plastic 5 gallon pails as chamber pots. Then periodically, (every few days, maybe a week depending on the situation) the 5 gallon pail (with snap- on lid) is transported to the **SCAT MACHINE** waste disposal system located nearby for disposal.

No, the pails and waste are not thrown away.

The user simply places the pail onto the **SCAT MACHINE**;

the lid is removed from the pail;

in less than two minutes the pail is automatically emptied, washed out, and sanitized. The clean pail is ready for use again. The machine does it all!

The waste is then properly disposed through sewage treatment methods.

One SCAT MACHINE, can serve a community of several hundred.

People are readily willing to properly dispose of their waste when utilizing these systems due to the sanitary and user friendly nature of this management and disposal method.

Users of the **SCAT MACHINE** systems say that they prefer this personalized system over community latrines, and or vault toilets", because it allows them to conveniently use and maintain *their own* sanitary toilet facilities, in the privacy of their own dwellings and businesses.

Ease and convenience equates to...

a more sanitary and safer survival environment.
